PREFACE

This Operation Manual was prepared by the General American Research Division (GARD) of the General American Transportation Corporation as a part of the Post Office Department Contract No. RE 49-67 for the development of a "Computer Program for Analysis of Energy Utilization in Postal Facilities". The project was monitored by Mr. James M. Anders of the POD's Bureau of Research and Engineering. The GARD team that worked on the project was headed by Mr. Metin Lokmanhekim, Manager of Thermal Systems and Computer Applications. Other GARD personnel who contributed to the project includes: Messrs. James Y. Shih, Robert H. Henninger, Charles C. Groth, Stephen J. Lis, Ajit L. Kapil, and Fred H. Bloedow.

We take this opportunity to acknowledge the guidance and inspiration received from our Project Monitor, Mr. James M. Anders. We were also very fortunate that the American Society of Heating, Refrigerating and Air Conditioning Engineers, Inc. (ASHRAE) became interested in this problem concurrent with our contract. Our appreciation is extended to the members of their Task Group on Energy Requirements for Heating and Cooling, whose technical efforts contributed to this project, with special thanks to:

Dr. T. Kusuda National Bureau of Standards of USA
Dr. D. G. Stephenson National Research Council of Canada
Mr. G. P. Mitalas National Research Council of Canada
Dr. K. Kimura National Research Council of Canada

SECTION 1

INTRODUCTION

The Computer Program for Analysis of Energy Utilization in Postal facilities is written in Fortran Language. During the development of the program, the CDC 3600, CDC 6600, Univac 1108, IBM 1130 and IBM 360 computer systems were utilized. In the final versions of the program, which are the IBM 360/65 and CDC 6600 versions, compatibility of the programs with each other is maintained as much as possible.

SECTION 2

CORE REQUIREMENTS AND THE DIMENSION STATEMENTS

2.1 Load Calculation Sub-program

Certain variables in the Load Calculation Sub-program have only one value. For instance, FNS, the number of spaces, is described by one number. The direct normal radiation, RDN, also take on one value, which varies with time, but may be described at any given time by one number. Such variables, called scalars, require only one location in the computer memory. This location is assigned automatically the first time scalar variable is used.

Other variables, however, possess a number of values. For example, AW, the area of a window, has as many values as there are windows in the building. The number of vertices of a shade polygon added to a window, FNVAW, has a different value, for each of the added shade polygons, for each window. Such multi-valued variables are called arrays or matrices. They each require more than one location in the computer's memory.

The computer does not assign such blocks of memory automatically. The number of values (the dimensions) of a matrix variable must be assigned by the use of special statements, called dimension statements.

The core requirements for running the program depend upon the numbers entered into the dimension statements. For the most efficient utilization of a computer system, the user of this program should arrange dimensions according to his applications.

NOTE: Since the computer does not accept "zero" for a dimension value, if a dimensioned variable is equal to zero, always use "ONE" for dimension value.

The dimension statements which require change are given in Table 1.

GLOSSARY

A : Number of spaces in building
B : Number of distinct delayed heat transfer surfaces in building
C : Number of distinct quick heat transfer surfaces in building
D : Number of distinct windows in building
E : Number of types of delayed heat transfer surfaces
F : Number of inside heat transfer surfaces in building
G : Number of underground walls in building
H : Number of underground floors in building
I : Maximum number of sides of any exterior heat transfer surface
J : Maximum number of sides of any exterior heat transfer or shading surfaces \((J \geq I)\)
K : Maximum number of shading surfaces deleted from any exterior heat transfer surface
L : Maximum number of shading surfaces deleted from a delayed heat transfer surface \((L \leq K)\)
M : Maximum number of shading surfaces added to a delayed heat transfer surface
N : Maximum number of sides of a delayed heat transfer surface
O : Maximum number of sides of a shading surface added to a delayed heat transfer surface
P : Maximum number of shading surfaces deleted from a quick heat transfer surface \((P \leq K)\)
Q : Maximum number of shading surfaces added to a quick heat transfer surface
R : Maximum number of sides of a quick heat transfer surface
S : Maximum number of sides of a shading surface added to a quick heat transfer surface
T : Maximum number of shading surfaces deleted from a window \((T \leq K)\)
GLOSSARY (CONT'D)

U : Maximum number of shading surfaces added to a window
V : Maximum number of sides of a window
W : Maximum number of sides of a shading surface added to a window
X : Number of common shading surfaces
Y : Maximum number of sides of a common shading surface
Z : Maximum number of shading surfaces added to any exterior heat transfer surface
AA : Maximum number of sides of a shading surface added to any exterior surface
AB : Maximum number of inside heat transfer surfaces in a space
AC : Maximum number of quick heat transfer surfaces in a space
AD : Maximum number of delayed heat transfer surfaces in a space
AE : Maximum number of underground walls in a space
AF : Maximum number of underground floors in a space
AG : Maximum number of windows in a space
AH : Number of pictures desired of shadows on delayed heat transfer surfaces
AI : Number of pictures desired of shadows on quick heat transfer surfaces
AJ : Number of pictures desired of shaded areas of windows
AK : Must exceed number of sides of any exterior heat transfer surface or any shading surface (for example: \( AK = J + 3 \))
AL : Maximum value of \((\text{number of commons} - \text{number of deletions} + \text{number of additions})\) for any exterior heat transfer surface
GLOSSARY (CONT'D)

AM : Maximum number of sides of any shading surface, common or added + \( \pm \).

AN, AO : Fineness of division of exterior heat transfer surface for shadow analysis (corresponds to \( x \) and \( y \) divisions of a surface).

2.1.1 Roof Selection Supporting Program

The core requirement of the Roof Selection Supporting program is as follows:

- CDC 6600 : 60 K (octal)
- IBM 360/65 : 200 K

2.1.2 Wall Selection Supporting Program

The core requirement of the Wall Selection Supporting program is as follows:

- CDC 6600 : 75 K (octal)
- IBM 360/65 : 200 K

2.2 Punch Sub-program

Dimension statements within the Punch Sub-program limit the number of space plot card output decks to 50. Core requirements for this program are indicated below:

- CDC 6600 : 60 K (octal)
- IBM 360/65 : 100 K
2.3 Editing Sub-program

Dimension statements within the Editing Sub-program enable a building of 200 spaces to be edited into at most, 50 fan systems, each with no more than 10 zones and no more than 20 spaces being combined into any zone. Core requirements are shown below:

CDC 6600 : 120 K (octal)
IBM 360/65 : 150 K

2.4 Thermal Loads Plot Sub-program

Any number of plots can be made during one run. This sub-program is for use only on the IBM 1130 computer system and requires 4 K of core for executing.

2.5 Systems Simulation Sub-program

Dimension statements within the System Simulation Sub-program allow a building to be analyzed that has no more than 50 fan systems, each with 10 zones. As many as 20 building equipment combinations can be run at one time. Core requirements for this sub-program are:

CDC 6600 : 60 K (octal)
IBM 360/65 : 200 K

2.6 Economics Analysis Sub-program

Any number of building equipment combinations can be analyzed by the Economics Analysis Sub-program at one time. Core requirements for this sub-program are:

CDC 6600 : 60 K (octal)
IBM 360/65 : 100 K

2.7 Packaged Systems Simulation Sub-program

The Packaged Systems Simulation Sub-program can handle a building as large as 30 spaces. Core requirements for this sub-program are:

CDC 6600 : 60 K (octal)
IBM 360/65 : 200 K
SECTION 3

CDC 6600, IBM 360/65, AND IBM 1130
COMPUTER SYSTEMS OPERATION CONTROL CARDS

Within this section, the control cards required for each sub-program are described for each type of computer system. The information to be punched on cards should always start in column 1, unless otherwise specified. The following symbols will be used to differentiate between the alpha "0" and numeric zero.

0 : alpha 0
Ø : numeric zero

3.1 CDC 6600 Computer System

3.1.1. Load Calculation Sub-program

1st Card
$SEQUENCE,XXXXX.
Note: XXXXX corresponds to the sequence number.

2nd Card
$JOB, XXXXX.
Note: XXXXXX corresponds to the account number.

3rd Card
$TAPE, SCR=Ø, OLD=Ø, NEW=Ø.

4th Card
$LEVEL, X.
Note: X corresponds to the priority level and can have values of Ø to 6.

5th Card
LOADS, Ø1, XXXX, XXXXXX.
Note: XXXX is the maximum Central Processor time required in octal seconds. XXXXXX is the maximum core required in octal and cannot be greater than $3ØØØØØ. 8
If the 136 characters per record version of SCOPE is to be used, the U.S. Weather Bureau tapes cannot be used directly by the CDC 6600, but must be copied onto another tape by means of the special program listed on page 10. The control card for this is then

REQUEST, TAPE1, HI. (XXXX/NORING) PLEASE RETURN FILE.

If the long record version of SCOPE is used, the U.S. Weather Bureau tape can be used directly by the CDC 6600. The control card for this then is

REQUEST, TAPE1, HI, X. (XXXX/NORING) PLEASE RETURN FILE.

Note: XXXX is the tape number which is assigned to the weather input tape.

The computer operator will assign this output tape a number. This tape number will be used later.

REQUEST, TAPE2, HI. (ASSIGN/RING) PLEASE PUT ON FILE.

Note: XXXXXX corresponds to the printed output line limit in octal and cannot be greater than 7777777.

78 ] in column 1

Same as for Load Calculation Sub-program, 8th through 11th Card.

10th Card
PROGRAM SELECR (INPUT, OUTPUT, TAPES=INPUT, TAPE6=OUTPUT)
seventh column
(PROGRAM SOURCE DECKS)

11th Card
Same as Load Calculation Sub-program, 13th Card.

(CARD INPUT DATA)

12th Card
Same as for Load Calculation Sub-program, 14th Card.

3.1.1.2 Walls Selection Supporting Sub-program
1st Card and 2nd Card
Same as for Load Calculation Sub-program.

3rd Card
$TAPE, SCR=∅, OLD=∅, NEW=∅.

4th Card
Same as for Load Calculation Sub-program.

5th Card
WALL, φ1, XXX, XXXXX.
See Load Calculation Sub-program, 5th Card, for explanation of XXX and XXXXX.
6th Card through 9th Card

Same as for Load Calculation Sub-program, 8th through 11th Card.

10th Card

PROGRAM SELECTW (INPUT, OUTPUT, TAPES=INPUT, TAPE6=OUTPUT)

——seventh column

(PROGRAM SOURCE DECK)

11th Card

Same as Load Calculation Sub-program, 13th Card.

(CARD INPUT DATA)

12th Card

Same as for Load Calculation Sub-program, 14th Card.

3.1.2 Punch Sub-program

1st Card

Same as for Load Calculation Sub-program.

2nd Card

Same as for Load Calculation Sub-program.

3rd Card

$TAPE, SCR=1, OLD=1, NEW=1.

4th Card

Same as for Load Calculation Sub-program.

5th Card

PUNC, 1, XXXX, XXXXXX.

See Load Calculation Sub-program for explanation of XXXX and XXXXXX.
6th Card

REQUEST, TAPE1, HI. (XXXX/NORING) PLEASE RETURN FILE.

Note: XXXX is the number of the input tape and is the same as that assigned in Section 3.1.1., 7th Card.

7th Card

REQUEST, TAPE7, HI. (ASSIGN/RING) PLEASE PUT ON FILE.

The computer operator will assign this output tape a number. The engineer must then fill out a Project Control Sheet and instruct the computer center to reproduce the information on this tape onto cards.

8th Card through 11th Card

Same as for Load Calculation Sub-program.

12th Card

PROGRAM PUNC (INPUT, OUTPUT, TAPE6$=INPUT, TAPE1, TAPE7)

(PROGRAM SOURCE DECK)

13th Card

Same as for Load Calculation Sub-program.

(CARD INPUT DATA)

14th Card

Same as for Load Calculation Sub-program.

3.1.3 Editing Sub-program

1st Card and 2nd Card

Same as for Load Calculation Sub-program.

3rd Card

$TAPE, SCR=$, OLD=$1$, NEW=$1$.

4th Card

Same as for Load Calculation Sub-program.
5th Card

EDIT, 01, XXXX, XXXXXX.

See Load Calculation Sub-program for explanation of XXXX and XXXXXX.

6th Card

REQUEST, TAPE1, HI. (XXXX/NORING) PLEASE RETURN FILE.

Note: XXXX is the number of the input tape and is the same as that assigned in Section 3.1.1., 7th Card.

7th Card

REQUEST, TAPE2, HI. (ASSIGN/RING) PLEASE PUT ON FILE.

Note: The computer operator will assign a number to this output tape.

8th Card through 11th Card

Same as for Load Calculation Sub-program.

12th Card

PROGRAM EDIT (INPUT, OUTPUT, TAPE6=INPUT, TAPE61=OUTPUT, TAPE1, TAPE2)

seventh column

(PROGRAM SOURCE DECK)

13th Card

Same as for Load Calculation Sub-program.

(CARD INPUT DATA)

14th Card

Same as for Load Calculation Sub-program.

3.1.4 Systems Simulation Sub-program

1st Card and 2nd Card

Same as for Load Calculation Sub-program.

3rd Card

$TAPE enumerated, SCR=∅, OLD=∅, NEW=∅.
4th Card
Same as for Load Calculation Sub-program.

5th Card
SYSIM,ophil,XXX,XXXX.
See Load Calculation Sub-program for explanation of XXX and XXXX.

6th Card
REQUEST,TAPE1,HI.(XXXX/NORING) PLEASE RETURN FILE.
Note: XXXX is the number of the input tape and is the same as that assigned in Section 3.1.1., 7th Card.

7th Card through 10th Card
Same as for Load Calculation Sub-program, 8th through 11th Card.

11th Card
PROGRAM SYSIM (INPUT,OUTPUT,TAPE6=INPUT,
seventh column
TAPE61=OUTPUT,TAPE1)
(MAIN PROGRAM AND SUBROUTINES SOURCE DECK)

12th Card
Same as for Load Calculation Sub-program, 13th Card.
(CARD INPUT DATA)

13th Card
Same as for Load Calculation Sub-program, 14th Card.

3.1.5 Economics Analysis Sub-program
1st and 2nd Card
Same as for Load Calculation Sub-program.

3rd Card
Same as for Load Calculation Sub-program, 4th Card.
4th Card

ECON,∅1,XXXX,XXXXX.

See Load Calculation Sub-program, 5th Card, for explanation of XXXX and XXXXXX.

5th Card through 8th Card

Same as for Load Calculation Sub-program, 8th through 11th Card.

9th Card

PROGRAM ECON (INPUT, OUTPUT, TAPE60=INPUT, TAPE61=OUTPUT)

seventh column

(PROGRAM SOURCE DECK)

10th Card

Same as for Load Calculation Sub-program, 13th Card.

(CARD INPUT DATA)

11th Card

Same as for Load Calculation Sub-program, 14th Card.

3.1.6 Packaged Systems Simulation Sub-program

1st Card through 4th Card

Same as for Systems Simulation Sub-program.

5th Card

PKGSY,∅1,XXXX,XXXXX.

See Load Calculation Sub-program for explanation of XXXX and XXXXXX.

6th Card through 10th Card

Same as for Systems Simulation Sub-program.

11th Card

PROGRAM PKGSY (INPUT, OUTPUT, TAPE60=INPUT, TAPE61=OUTPUT, TAPE1)

seventh column

17
(PROGRAM SOURCE DECK)

12th Card

Same as for Systems Simulation Sub-program.

(CARD INPUT DATA)

13th Card

Same as for Systems Simulation Sub-program.
